Supplement: configuration inventory for "Noise Covariance Defines Reconstruction Geometry"

Dowling Wong

Draft of 11 September 2026

This supplement lists every configuration value read mechanically from the frozen configuration files of the experiment repository, with the repository path each value was read from (experiment P1-E4b; source file `evidence/data/paper1/P1-E4b/hyperparameters.csv`, generated into `generated/tables/tab_hyperparameters_full.tex` by `figures_src/make_paper1_evidence.py`). The inventory records what the configuration files say; which configuration a given run used is recorded by the `config_hash` in that run's manifest, and overrides are listed in the protocol table of the main paper. Rows belonging to the planted-generator experiments are printed only in the build that carries the separable-class evidence.

Table 1: Configuration inventory (P1-E4b): every value read mechanically from the frozen configuration files of the experiment repository, with the path it was read from; 363 rows from 25 source files in the full inventory (the rows of the planted-generator group appear only in the build that carries the separable-class evidence). This records what the configurations *say*; the link from a run to the configuration it used is the `config_hash` in that run's manifest.

Group	Parameter	Value	Source
